Primordial black holes as a potential candidate

A photograph of a radio telescope array at night. Four large, white, parabolic dish antennas are mounted on concrete bases. The sky is dark blue and filled with stars, with the Milky Way galaxy visible as a bright, hazy band of light stretching across the upper left. A bright, circular light source, likely the Moon, is visible on the right side of the image. The foreground is dark and flat, suggesting a desert or high-altitude environment.

How to observe the signals from PBHs?

Image Credit: ESO

Image Credit: ESO

$$h(t) = \frac{4}{d_L(z)} \left(\frac{G\mathcal{M}_z}{c^2} \right)^{5/3} \left(\frac{\pi f(t)}{c} \right)^{2/3} \cos \Phi(t)$$

$$d_L = \frac{1+z}{H_0} \int_0^z \frac{c}{E(z')} dz' \quad \mathcal{M}_z = \mathcal{M}(1+z)$$

$$h(t) = \frac{4}{d_L(z)} \left(\frac{G\mathcal{M}_z}{c^2} \right)^{5/3} \left(\frac{\pi f(t)}{c} \right)^{2/3} \cos \Phi(t)$$

$$d_L = \frac{1+z}{H_0} \int_0^z \frac{c}{E(z')} dz' \quad \mathcal{M}_z = \mathcal{M}(1+z)$$

$$\Delta t = \frac{1}{H_0} \int_{z_1}^{z_2} \frac{dz}{E(z)(1+z)}$$

How to construct redshift-distance (redshift-time) relation?

How to construct redshift-distance (redshift-time) relation?

A statistical study on PBH binaries may help

PBH formation

The primordial origin gives an identical primordial mass function

$$n(M) = \frac{f_{\text{PBH}}}{\sqrt{2\pi}\sigma M} \exp\left[-\frac{\ln^2(M/M_{pk})}{2\sigma^2}\right]$$

PBH binary formation

The equation of proper separation r of two nearby PBHs with mass M is

$$\ddot{r} - (\dot{H} + H^2)r + \frac{2M}{r^2} \frac{r}{|r|} = 0$$

PBH binaries were formed with an identical probability distribution

$$\frac{dP}{dade} = \frac{3}{4} f_{\text{PBH}}^{3/2} \frac{a^{1/2}}{\bar{x}^{3/2}} \frac{e}{(1 - e^2)^{3/2}}$$

Ali-Haïmoud, Yacine, Ely D. Kovetz, and Marc Kamionkowski. "Merger rate of primordial black-hole binaries." *Physical Review D* 96.12 (2017): 123523.

Primordial Black Hole Binaries as A Standard Timer

The initial probability distribution on a and e

$$\frac{dP}{da de} = \frac{3}{4} f_{\text{PBH}}^{3/2} \frac{a^{1/2}}{\bar{x}^{3/2}} \frac{e}{(1 - e^2)^{3/2}}$$

A single parameter standard timer

Initial state: Initial statistical distribution of dynamical systems

$$S(M; t_i) = \frac{dN}{dM_i}$$

Dynamics: time evolution of parameter in dynamical systems

$$\frac{dM}{dt} = -f(M) \Rightarrow \int_{M_i}^{M_t} \frac{dM}{f(M)} = g(M_t) - g(M_i) = -\Delta t$$

Later state: Statistical distribution of dynamical systems at physical time t

$$S(M; t) = \frac{dN}{dM_i} \frac{dM_i}{dM_t} = S(M; t_i) \frac{g'(M_t)}{g'(g^{-1}(g(M_t) + \Delta t))}$$

Observed state: Redshifted statistical distribution of dynamical systems detected at redshift z

$$S_o(M_z; t) = S_o(M_z; t_i) \frac{g'(M_z)}{g'(g^{-1}(g(M_z) + \Delta t_z))}$$

Redshift-time relation: Comparing the observed state with the initial state gives the **redshift-time relation**

$$S_o(M_z; t) \simeq \begin{cases} S(M; t_i) \frac{dM_i}{dM_i(z)} & , \quad g(M_z) \gg \Delta t_z \\ S_o(g^{-1}(\Delta t_z); t_i) \frac{g'(M_z)}{g'(g^{-1}(\Delta t_z))} & , \quad g(M_z) \ll \Delta t_z \end{cases}$$

A multi-parameter standard timer

Initial state: Initial statistical distribution of dynamical systems

$$S(\mathbf{M}; t_i) = \frac{dN}{d^n \mathbf{M}_i}$$

Dynamics: time evolution of parameter in dynamical systems

$$\frac{d\mathbf{M}}{dt} = -\mathbf{f}(\mathbf{M})$$

Later state: Statistical distribution of dynamical systems at physical time t

$$S(\mathbf{M}; t) = \frac{dN}{d^n \mathbf{M}_i} \det \mathbf{J}(\mathbf{M}, \Delta t) = S(\mathbf{M}; t_i) \det \mathbf{J}(\mathbf{M}, \Delta t)$$

$$\mathbf{J}_{ij} \equiv \partial M_i(t_i) / \partial M_j(t)$$

Observed state: Redshifted statistical distribution of dynamical systems detected at redshift z

$$S_o(\mathbf{M}_z; t) = \frac{dN}{d^n \mathbf{M}_i(z)} \det \mathbf{J}(\mathbf{M}_z, \Delta t_z)$$

How to extract the physical evolution time?

The evolution of probability distribution in PBH binaries

$$\frac{dP}{da_t de_t} = \frac{dP}{da_i de_i} \det J(a, e, \Delta t)$$

$$J(a, e, \Delta t) = \begin{pmatrix} \partial a_i / \partial a_t & \partial a_i / \partial e_t \\ \partial e_i / \partial a_t & \partial e_i / \partial e_t \end{pmatrix}$$

$$\frac{da}{dt} = -\frac{128}{5} \frac{G^3 M_{\text{PBH}}^3}{c^5 a^3 (1 - e^2)^{7/2}} \left(1 + \frac{73}{24} e^2 + \frac{37}{96} e^4 \right)$$

$$\frac{de}{dt} = -\frac{608}{15} \frac{G^3 M_{\text{PBH}}^3}{c^5 a^4} \frac{e}{(1 - e^2)^{5/2}} \left(1 + \frac{121}{304} e^2 \right)$$

How to extract the redshift from the observable?

Redshifted Chirp Mass

$$\mathcal{M}_z = (1 + z)\mathcal{M}$$

B. P. Abbott et al. Observation of Gravitational Waves from a Binary Black Hole Merger. Phys. Rev. Lett., 116(6):061102, 2016.

$$\mathcal{M}_{z_3} = (1 + z_3)\mathcal{M}$$

$$\mathcal{M}_{z_2} = (1 + z_2)\mathcal{M}$$

$$\mathcal{M}_{z_1} = (1 + z_1)\mathcal{M}$$

$$\frac{dP}{da_z} = \frac{1}{1+z} \frac{dP}{da_i}$$

$$\Delta t = \int_{z_1}^{z_2} \frac{dz}{H(z)(1+z)}$$

$$H(z) = H_0 \sqrt{\Omega_\gamma (1+z)^4 + \Omega_m (1+z)^3 + \Omega_\Lambda}$$

Merger rate of PBH binaries as a probe of Hubble parameter

PBH mass function

$$n(M) = \frac{1}{\sqrt{2\pi}\sigma M} \exp \left[-\frac{\ln^2(M/M_{pk})}{2\sigma^2} \right]$$

$$\mathcal{M}_z = (1 + z)\mathcal{M}$$

$$d_L = \frac{1 + z}{H_0} \int_0^z \frac{c}{E(z')} dz'$$

B. P. Abbott et al. Observation of Gravitational Waves from a Binary Black Hole Merger. Phys. Rev. Lett., 116(6):061102, 2016.

$$h(t) = \frac{4}{d_L(z)} \left(\frac{G\mathcal{M}_z}{c^2} \right)^{5/3} \left(\frac{\pi f(t)}{c} \right)^{2/3} \cos \Phi(t)$$

$$(m_z^i, d_L^i)$$

$$d_L^i = \frac{1 + z_i}{H_0} \int_0^{z_i} \frac{c}{E(z')} dz'$$

Assume a Hubble parameter \tilde{H}_0

$$z_i = z(d_L^i; \tilde{H}_0)$$

$$m^i = m_z^i / (1 + z_i)$$

$$(m_z^i, d_L^i)$$

$$d_L^i = \frac{1 + z_i}{H_0} \int_0^{z_i} \frac{c}{E(z')} dz'$$

Assume a Hubble parameter \tilde{H}_0

$$z_i = z(d_L^i; \tilde{H}_0)$$

$$m^i = m_z^i / (1 + z_i)$$

Connection

$$C(m_1^z, m_2^z) = \int_0^\infty \int_0^{\frac{m_1^z}{1+z}} \int_0^{\frac{m_2^z}{1+z}} n(m_1) n(m_2) W(m_1, m_2; z) p(z) dm_1 dm_2 dz$$

detectable window function

PBH mass function
redshift distribution

$$P(m_1^z, m_2^z) = \frac{\partial^2 C(m_1^z, m_2^z)}{\partial m_1^z \partial m_2^z}$$

$$P(m_1^z, m_2^z) = \int_0^\infty n\left(\frac{m_1^z}{1+z}\right) n\left(\frac{m_2^z}{1+z}\right) W\left(\frac{m_1^z}{1+z}, \frac{m_2^z}{1+z}; z\right) \frac{p(z)}{(1+z)^2} dz$$

$$W(m_1,m_2;z)=\frac{N_{\rm obs}(m_1,m_2;z)}{N_{\rm tot}(m_1,m_2;z)}=\int_{a_{\rm min}}^{a_{\rm max}}\int_{e_{\rm min}}^{e_{\rm max}}P(a,e;z)\,dade$$

$$\mathrm{SNR}=\sqrt{4\int_{f_{\mathrm{min}}}^{f_{\mathrm{max}}}\frac{|\tilde{h}(f)|^2}{S_n(f)}df}>8\quad \tilde{h}(f)=\sqrt{\frac{5}{24}\frac{(G\mathcal{M}_z)^{5/6}}{\pi^{2/3}c^{3/2}d_L}}f^{-7/6}$$

$$p(z) \propto \frac{\dot{n}(z)}{1+z} \frac{dV_c}{dz} \qquad \dot{n}(z) \propto \left(\frac{t(z)}{t_0}\right)^{-34/37}$$

$$n(m) = \frac{1}{\sqrt{2\pi}\sigma m} \exp \left[-\frac{\ln^2(m/m_{pk})}{2\sigma^2} \right]$$

$$n(m) = \frac{\alpha - 1}{M} \left(\frac{m}{M} \right)^{-\alpha}$$

$$P_O(m_1^z, m_2^z) = \int_0^\infty n_p\left(\frac{m_1^z}{1+z}\right) n_p\left(\frac{m_2^z}{1+z}\right) W\left(\frac{m_1^z}{1+z}, \frac{m_2^z}{1+z}; z\right) \frac{p(z)}{(1+z)^2} dz$$

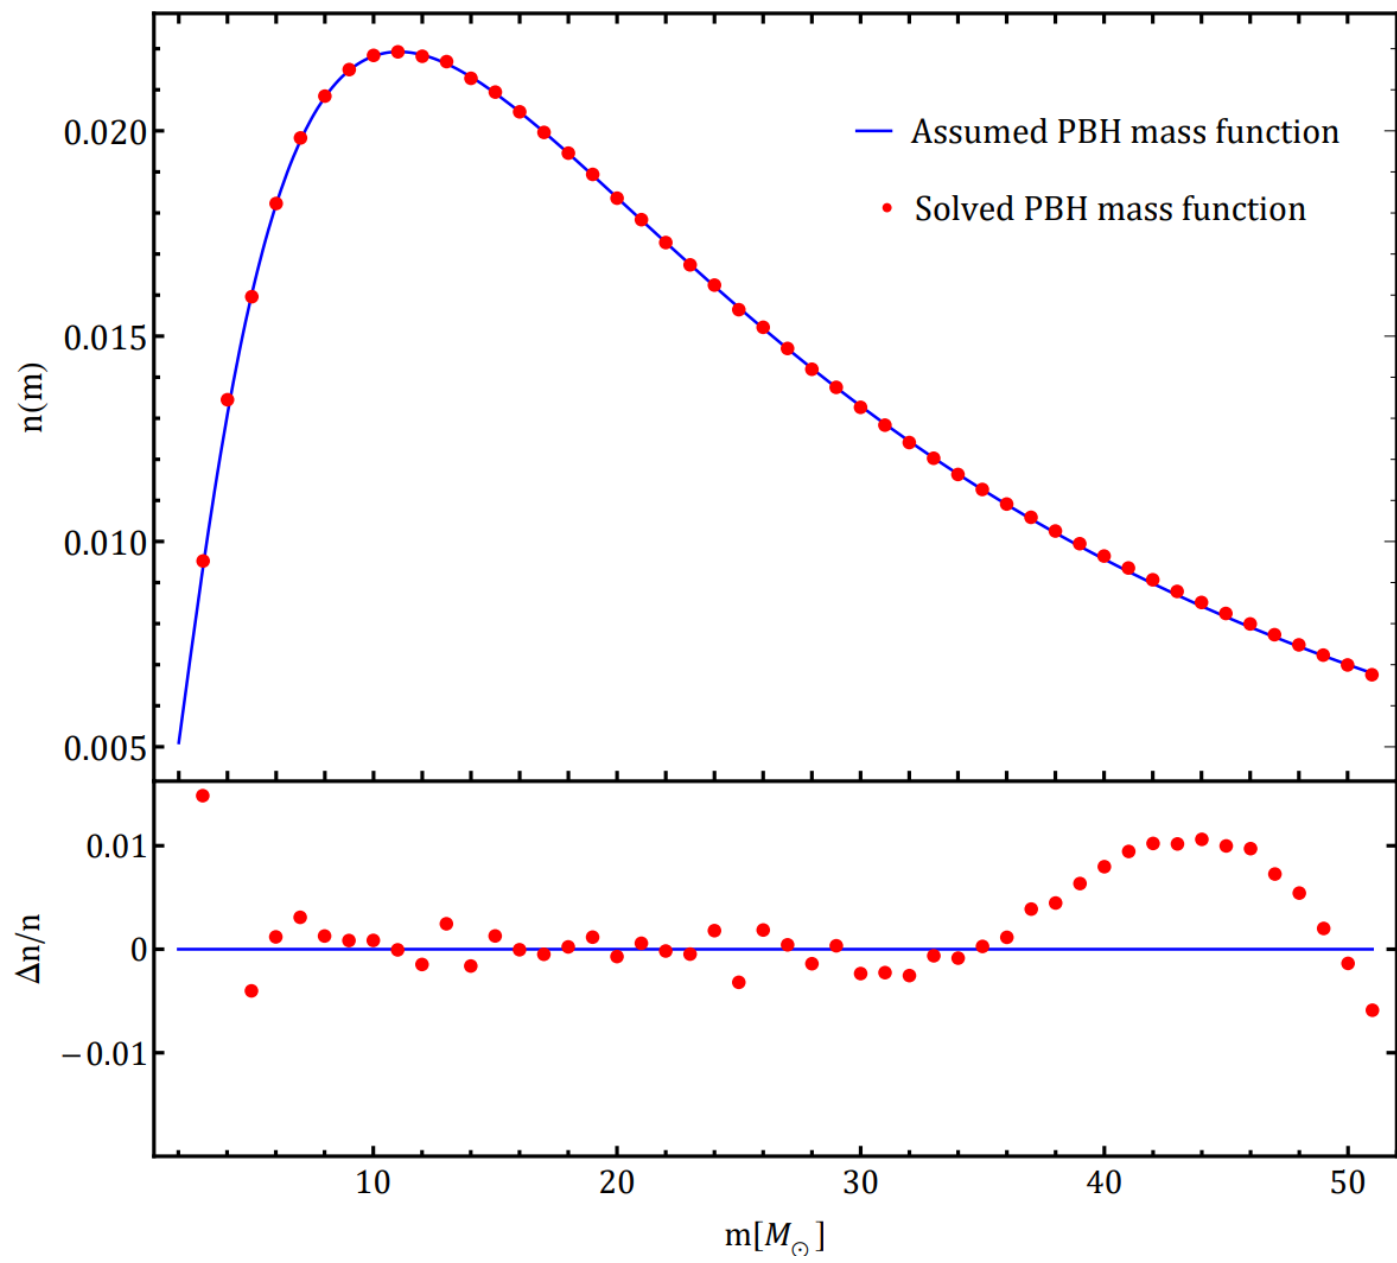

Gradient Descent Method

$$P_O(m_1^z, m_2^z) = \int_0^\infty n_p \left(\frac{m_1^z}{1+z} \right) n_p \left(\frac{m_2^z}{1+z} \right) W \left(\frac{m_1^z}{1+z}, \frac{m_2^z}{1+z}; z \right) \frac{p(z)}{(1+z)^2} dz$$

$$P_T(m_1^z, m_2^z) = \int_0^\infty n' \left(\frac{m_1^z}{1+z} \right) n' \left(\frac{m_2^z}{1+z} \right) W \left(\frac{m_1^z}{1+z}, \frac{m_2^z}{1+z}; z \right) \frac{p(z)}{(1+z)^2} dz$$

$$E(n) = \sqrt{\frac{\sum_{1 \leq i \leq j, j=1}^{j=N} [P_T(m_1^z, m_2^z) - P_O(m_1^z, m_2^z)]^2}{(1+N)N/2}}$$

$$n_{k+1}(m_i) = n_k(m_i) - \gamma \frac{\partial E(n_k)}{\partial n_k(m_i)}$$

$$P_O(m_1^z, m_2^z) = \int_0^\infty n_z \left(\frac{m_1^z}{1+z} \right) n_z \left(\frac{m_2^z}{1+z} \right) W \left(\frac{m_1^z}{1+z}, \frac{m_2^z}{1+z}; z \right) \frac{p(z)}{(1+z)^2} dz$$

$$n_z(m_z) = n_i(m_i) \frac{dm_i}{dm_z} = n_i(m_i) g(z, m_z)$$

$$\frac{dm}{dt} = 4\pi\lambda\rho_m \frac{G^2 m^2}{v_{\text{eff}}^3}$$

$$P_O(m_1^z, m_2^z) = \int_0^\infty n_i \left(\frac{m_1^z}{1+z} \right) n_i \left(\frac{m_2^z}{1+z} \right) g(z, \frac{m_1^z}{1+z}) g(z, \frac{m_2^z}{1+z}) \\ \times W \left(\frac{m_1^z}{1+z}, \frac{m_2^z}{1+z}; z \right) \frac{p(z)}{(1+z)^2} dz$$

How about $p(z)$?

$$\left. \begin{aligned} d_L^i &= \frac{1+z_i}{H_0} \int_0^{z_i} \frac{c}{E(z')} dz' \\ \text{Assume a Hubble parameter } \tilde{H}_0 \\ z_i &= z(d_L^i; \tilde{H}_0) \end{aligned} \right\} p(z; \tilde{H}_0)$$

$$P_O(m_1^z, m_2^z) = \int_0^\infty \tilde{n}\left(\frac{m_1^z}{1+z}\right) \tilde{n}\left(\frac{m_2^z}{1+z}\right) W\left(\frac{m_1^z}{1+z}, \frac{m_2^z}{1+z}; z\right) \frac{p(z; \tilde{H}_0)}{(1+z)^2} dz$$

However, we don't know the PBH mass function currently.

However, we don't know the PBH mass function currently.

Another observable related with PBH mass function

Merger rate of PBH binaries

$$R_{ij} = \rho_{\text{PBH}} \min\left(\frac{n(m_i)}{m_i}, \frac{n(m_j)}{m_j}\right) \Delta_m \frac{dP}{dt}$$

$$\dot{N} = \int_{z_{\min}}^{z_{\max}} \frac{R}{1+z} \frac{dV_c}{dz} dz$$
